Over the course of a given year without considering factors like heavy rain or snowfall, here it's easy to see how all five competitors compare. This analysis then raises the question how excess solar energy can be distributed across businesses and power homes in th..

Buffer Density

Annual Solar Irradiance

By analyzing the buffer area around each grocery store (*0.010000 degrees in radius*) stakeholders can understand how both neighboring businesses in places like downtown Chattanooga, or more suburban areas like Hixson Pike or Signal Mountain Road can increase in their total property value. This community solar concept is already in motion in Chattanooga with [EPB's Solar Share initiative](#), generating 32,306 kWh from Jun 28th to July 4th. Other examples of community solar's benefits can be seen at:

* [KUB Community Solar](#) - Offsets carbon footprint and allows local businesses to receive credits to reduce monthly electricity bills.

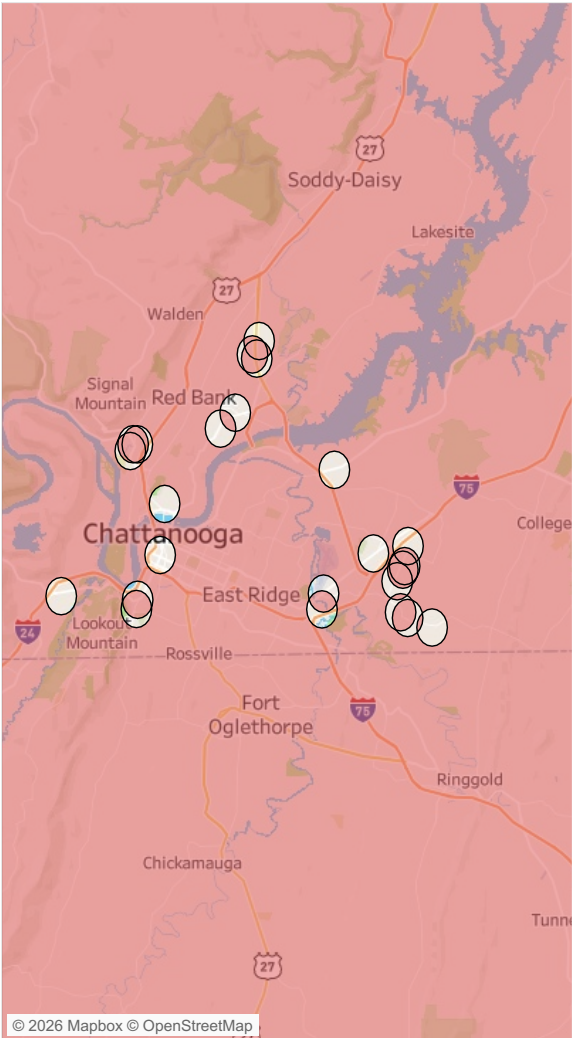

* [Georgia Power's Community Solar Program](#) - Provides community solar to residents near Augusta, Athens, and Savannah.

* [Berkeley Electric Cooperative's Community Solar Project](#) - Available for Monocks Corner, South Carolina residents, prices range from \$20 for the upfront cost, and a \$10 monthly subscription per solar panel block.

Buffer Density

Annual Solar Irradiance

Further, the United States Department of Energy’s [Integrated Energy Systems Office](#) has documented community solar projects as of 2024, and notes that there are “7.87 GW of community solar operations in the US. The state of Florida leads in this pursuit in 2,085,387 MW-AC (alternating current), with New York state coming in second at 1,764,118 MW-AC.

While EPB’s community solar project is a major step, in the context of Tennessee, there are six other cities participating in community solar projects - Nashville (Music City Solar), College Grove (Cooperative Solar Program), Shelbyville (DREMC Solar Farm), Knoxville, New Market (Co-op Community Solar), Telford (Brightridge Solar). Thus, if in this situation, EPB were to install solar arrays at each of these retailers, it would increase the amount of total available subscriptions, and further increase the community solar footprint for Chattanooga, while also decreasing the average cost of utilities/electricity in the city.
